

About Sharefile

What is ShareFile?

ShareFile is a secure content collaboration, file sharing and sync solution that supports all the document-centric tasks and workflow needs of small and large businesses.

What is secure file sharing?

Truly secure services, including ShareFile, use encryption protocols for sharing and storing files on secure data centers, or the cloud. A good secure file transfer software will have plenty of customizable features to allow you to add as much protection to your data as you need without making the way you work any more difficult.

How safe is Sharefile?

You can trust online file sharing services that utilize advanced encryption methods to store and send your files. Sharefile is a safe online file sharing site that protects documents with SSL/TLS encryption protocols and uses multi-factor authentication. The Sharefile portal we utilize is specific to our industry and supports our particular compliance requirements.

What is the maximum file size I can upload?

The ShareFile system supports the upload and download of files up to 10GB or 100GB in size, depending on plan level. If your upload process cannot be completed within 18 hours, ShareFile recommends breaking your upload into smaller segments.
